Project/Assignment Decisions

After a few hours of attempting to find the right sprites and backgrounds that work with the current files, I succeeded with the characters, but the backgrounds almost made me give up. So I turned to Copilot, which helped me finish the backgrounds and sound effects part of the sidequest.

GenAI Documentation

If GenAI was used (keep each response as brief as possible):

Date Used: Fri March 13

Tool Disclosure: Copilot

Purpose of Use:
Debugging, and problem solving

Summary of Interaction:
I had issues with figuring out how to work the backgrounds and playing sound effects and so I turned to copilot to help complete those parts for me.

Human Decision Point(s):
Mid way through making changes to both the backgrounds and sound effects Copilot made my game crash several times, in which I had to cut the programming off and restart, giving a new prompt.

Integrity & Verification Note:
Whilst Copilot worked, I constantly checked its work by going into the preview and testing if everything worked fine.

Scope of GenAI Use:
I found all of the sprites and tilesets and also inputted the player character: HalberdMan, enemy character: SpearMan, and DraculaCat: Objective myself.

Limitations or Misfires:
The tool messed up my Draculacat's quality but I couldn't fix it as it was the bit size that changed the quality and if I kept the bit size the same it caused bugs with my SpearMan characters.

Summary of Process (Human + Tool)
Describe what you did, focusing on process rather than outcome.

- Testing and revision: I made sure to test what Copilot provided me as much as possible to ensure there weren't any breaks to the game
- Moments of uncertainty, failure, or rework: A lot of problems arised with trying to understand how to fix the backgrounds and Copilot helped realize that even though the original files were gone, the code was still trying to call the old files, even after loading my new ones.
- Decision Points & Trade-offs: With a little bit of back and forth I was able to use Copilot to rewrite those parts of the code so that my new background set could actually appear in the game.

Describe one or two key decisions you made:
Using Copilot:
Other than turning to Copilot, I considered giving up because many of the sprites I was finding weren't working when I coded them in and the backgrounds were also failing. Nothing worked until I found a sprite that worked with the code (coincidentally its from the same people who made the wolf and boar), this gave me hope again and I ended up being able to complete everything else with Copilot.

Transcript with Copilot

can you make my drculacat.png image a little smaller it is bugging the enemy characters out

Read assets

```

I've resized your `drculacat.png` image to make it a little smaller. It was originally 192x32 pixels, and now it's 144x24 pixels (75% of the original size). The aspect ratio has been maintained. If you'd like it even smaller or a different size, just let me know!

why is my new background not working

Edited

AssetLoader.js+4-4

The issue was a syntax error in AssetLoader.js (an extra "f;" on line 206) that was preventing the background loading function from working properly. I've fixed that and also corrected the default background image paths to include the proper "assets/" prefix and ".png" extension.

If your "new background" refers to different images (like the "Background Castle .png" or "GandalfHardcore Background layers_layer X.png" files in your assets folder), you'll need to update the parallax array in levels.json to point to the correct paths. For example, change:

```
"parallax": [
 { "img": "assets/GandalfHardcore Background layers_layer 1.png", "speed": 0.2 },
 { "img": "assets/GandalfHardcore Background layers_layer 2.png", "speed": 0.4 },
 { "img": "assets/GandalfHardcore Background layers_layer 3.png", "speed": 0.6 }
]
```

he game should now load backgrounds correctly. If you're still having issues, let me know which specific background images you're trying to use!

it still doesnt load any background its just gray

```
ls -la /Users/tabishnazary/Documents/GitHub/tnazary_sidequest_w6/assets/background_layer_*.png
```

```
git status --porcelain | grep background
```

levels.json+3-3

Edited

main.js+5-6

Read main.js, lines 100 to 120

Edited

main.js+11-0

The background was gray because the original `background_layer_*.png` files were deleted from your assets folder, but levels.json was still trying to load them. I've updated levels.json to use the existing "GandalfHardcore Background layers_layer *.png" files instead.

Additionally, the parallax images were being loaded synchronously with loadImage(), which doesn't wait for the images to finish loading before starting the draw loop. I've changed it to load them asynchronously so the backgrounds are fully loaded before the game starts drawing.

Your new backgrounds should now appear correctly! If you want to use different images, just update the parallax array in levels.json with the correct paths.

CHARACTER GLITCHING ISSUE

can you input all the sfx into the game

✓ Inspected sound effects and updated SoundManager

```
nl -ba src/SoundManager.js | sed -n '1,120p'
```

```
19    constructor() {
20      this.sfx = {};
21    }
22
23    load(name, path) {
24      this.sfx[name] = loadSound(path);
25    }
26
27    play(name) {
28      this.sfx[name]?.play();
```

✓ Edited SoundManager.js +22 -2

✓ Patched sound effects and updated event listeners

✓ Edited main.js +8 -0

✓ Patching event listeners

✓ Edited Game.js +5 -1

✓ Verified player events and sound associations

✅ All SFX are now properly loaded and wired into the game so they actually play when the corresponding game events fire.

🔊 What I added (SFX loading + wiring)

✅ Loaded all sound files from sfx

In main.js (during boot), I now load every sound file under sfx using SoundManager.load() :

README.md

Describe what to build next

Agent Auto

Restore Checkpoint

whatever it is tha is messing up the loading isnt in assets, its in wherever you changed the sounds, can you please add in all the sound effects without breaking the game

SoundManager.js

✓ Evaluated and addressed sound manager issues

✓ Edited SoundManager.js +19 -2

✓ Edited main.js +13 -0

✓ Troubleshot and fixed sound loading issues

✓ Edited Game.js +2 -0

✓ Ensuring sound keys align

✅ I re-added **all SFX** safely so they won't crash the boot process, and I wired the game events to play them.

✅ What was fixed (no more boot-breaking sound load)

The **crash was caused by** loadSound() **throwing** (usually when audio is blocked or missing) and that exception was stopping the entire boot process.

I updated SoundManager.load() to **catch those exceptions and continue**, so even if audio fails to load, the game still loads.

✅ All SFX now loaded (without breaking the game)

The following sound files are now loaded in main.js (during boot()):

can you now add the background music as well
